With disability	<b>51.0</b>

## About

This indicator is the percentage of citizens [among those who required one of these tests: MRIs, CAT scans and angiographies, in a non-emergency situation in the last 12 months] who waited less than a month for a diagnostic test.

## Source

Primary Health Survey and Primary Care Survey

## Calculations

This indicator is based on respondents who have required one of these tests: MRIs, CAT-scans or angiographies provided in a non-emergency situation in the last 12 months. This indicator is calculated by dividing the number of respondents who answered "less than one month" by the number of respondents who answered "less than one month, 1 to 3 months or longer than 3 months" to the question: How long did you have to wait between when you and your doctor or nurse decided to go ahead with the test and the day of the test? If you have had more than one in the last 12 months, please answer with the most recent in mind.

## Notes

The 2020 edition of the Primary Health Survey (PHS) was conducted during the COVID-19 pandemic. While the pandemic did not influence the survey's response rate, NBHC had to assess the impact of surveying during the pandemic. Accordingly, advanced statistical analyses were performed to allow for comparison between the results obtained in 2020 and those obtained in previous PHS cycles. Despite these analyses, users are advised to use the PHS 2020 data with caution, especially when creating estimates for small sub-populations or when comparing it to other PHS editions.

Unit	Interpretation	NBHC code
%	Higher is better	PH_ACCOE_1
