Persons with a disability				
Without disability	23.4	20.0	22.4	n/a
With disability	34.1	34.7	36.0	n/a

About

This indicator is the percentage of citizens who always or usually talk to a health professional about things they could do to improve their health or prevent illness like stop smoking, drink less alcohol, eat better, and exercise.

Source

New Brunswick Health Council, Primary Health Survey

Calculations

This indicator is calculated by dividing the number of respondents who answered "usually or always" by the number of respondents who answered "never, rarely, sometimes, usually or always" to the question: In the past 12 months, how often did you talk with a doctor, nurse, or other health professional about things you could do to improve your health or prevent illness like stop smoking, drink less alcohol, eat better, and exercise?

Notes

The 2020 edition of the Primary Health Survey (PHS) was conducted during the COVID-19 pandemic. While the pandemic did not influence the survey's response rate, NBHC had to assess the impact of surveying during the pandemic. Accordingly, advanced statistical analyses were performed to allow for comparison between the results obtained in 2020 and those obtained in previous PHS cycles. Despite these analyses, users are advised to use the PHS 2020 data with caution, especially when creating estimates for small sub-populations or when comparing it to other PHS editions.
