About this Table

The Population Health Snapshot is a representation of the health of the population based on the <u>Population Health Model</u> that aims to inform individuals, communities, and organizations about the health status of the population with respect to the region they live in or provide services to.

It consists of 35 indicators for New Brunswick and each of the <u>7 health zones</u>, that compare where each zone stands in comparison to the others.

What do we measure?

The indicators in our Snapshot fall within one of two categories:

- Health Outcomes; or
- Determinants of health (grouped into: Health Services, Health Behaviours, Social and Economic Factors, and Physical Environment).

The indicators are updated with the most recent information available to us.

How can the snapshots be used?

The population health snapshots help answer "how do we compare to others?" To facilitate the identification of areas of strengths and areas of improvement, this year, the Snapshots include green and red flags that highlight the indicators where the zone performs better or worse than other zones, based on a Z-score analysis.

What is a Z-Score?

A Z-score is a numerical measurement that describes a value's relationship to the mean of a group of values (normal distribution of values). A Z-score is measured in terms of standard deviations from the mean. If a Z-score is 0, it indicates that the data point's score is identical to the mean score. A Z-score of 1.0 (or -1.0) would indicate a value that is one standard deviation from the mean. For the Population Health Snapshot, a Z-score of 1.282 is the cut point used to display flags that inform on health zone values that are far enough from the mean to be deemed better or worse than the average.
