High school or less	66.1
Postsecondary	65.5

## About

This indicator is the percentage of acute care patients who reported that they had complete information and understanding of their medications, conditions and treatment when leaving the hospital.

## Source

Hospital Acute Care Survey

## Calculations

This indicator is calculated by taking the sum of the weighted proportions obtained for the following three indicators: AU\_DCT01\_1, AU\_DCT02\_1 and AU\_DCT03\_1. This sum of weighted proportions is then divided by the sum of the weighted number of respondents to these same three indicators. The questions to which these indicators refer are as follows: 'Before you left the hospital, did you have a clear understanding about all of your prescribed medications, including those you were taking before your hospital stay?', 'Did you receive enough information from hospital staff about what to do if you were worried about your condition or treatment after you left the hospital?' and 'When you left the hospital, did you have a better understanding of your condition than when you entered?'. This composite score calculation methodology is the same as the one used by the Canadian Institute for Health Information (CIHI).
