Avoidable mortality from preventable causes: Premature deaths that could potentially have been prevented through primary prevention efforts (e.g. screening, vaccination, healthy lifestyles, air quality, etc.)

Avoidable mortality from treatable causes: Premature deaths that could potentially have been avoided through secondary or tertiary prevention (e.g. treatment and interventions that can reduce the fatality of the health condition).

<sup>\*</sup>Avoidable mortality refers to untimely deaths that should not occur in the presence of timely and effective health care or other public health practices, programs and policy interventions. It can be divided into two causes:
